QuickDraw The AutoCAD system contains a library which is not normally loaded, and has not changed since release 16. This library, referred to as the [QD] library or simply the 'QD' library is a new release of the AutoCAD System Library 'QD' as a stand alone library was released (version 1.0) in late 1996, to create AutoCAD objects from a proprietary dxf file, and the application object still has to be able to create an application object by itself without loading the QD library. The components are stored in the QD database file, which is a database file formatted using the Windows native database format. This format makes the data and the table structure of the components highly flexible and the database files easily modifiable. QD files have the same file format as QuickDraw (QD) files, and can be written with, or read with, QD applications. The QD library also has extensive printing features, including some support for XPS printing. The API for the QD library is C++/CLI, and is a stand-alone library that does not have to be loaded as a dependent library, making it highly portable. Included in the QD library are tools for the design of data structures, and more than a dozen, mostly vector graphics related, classes for drawing and presentation tools. C++ and C# The C++ library is a 3D model viewer. It is platform independent and uses an internal three-dimensional model. The model database supports the following standard data types: string integer (signed and unsigned) real rational complex The C++ library is a design time extension of the AutoCAD object model. It can be used to add custom data types, such as metadata and presentation styles to a drawing. AutoCAD uses C++ for its CAD database and for toolbox plugins. The C++ library is not normally loaded and has not changed

since release 16. It contains a.lib file for linking the C++ library into applications, that can be found at the location where the applications were compiled. AutoCAD has a predefined C++ object model for toolbox plugins. The C++ Toolbox contains a set of classes for handling 3D data, such as: Geometry Geometry information Extrusion Spline Surface Toolbox (plugin) Since version 2010, ca3bfb1094
